

# NARANDA & BANNITUP ANGUS

**ON PROPERTY SALE**

**14 MARCH 2024  
10:30AM  
1184, MERIVALE RD  
ESPERANCE, WA 6450**

Breeding quality cattle with integrity for a profitable future

NEW

GET

TWICE AS TOUGH

ON  
WORMS

DECTOMAX

LEVAMISOLE

DECTOMAX V<sup>®</sup>

doramectin and levamisole injection

AUSTRALIA'S FIRST DUAL ACTIVE INJECTABLE DRENCH FOR CATTLE

Introducing Dectomax V...the first injectable harnessing the trusted power of Dectomax, with the added strength of levamisole, in a single injection.

- New Dual Active Drench Technology - resistance breaking
- Easy injectable administration for highly reliable dosing
- High efficacy, broad spectrum parasiticide\*
- Treats gastrointestinal worms, cattle tick, sucking lice

AVAILABLE AT YOUR LOCAL  
VET & RURAL RESELLER

Dectomax V for victory. Stop resistance developing on your property.  
PREMIUM PERFORMANCE FOR LEADING CATTLE PRODUCERS

\*Overall mean efficacy (GM) of 99.8% across thirteen field studies. Zoetis data on file.

# SALE INFORMATION

## DIRECTIONS:

The sale will be held at Naranda Springs, located 20kms east of Esperance on the Merivale Road. Travel towards Cape Le Grand National Park. Naranda Springs is on the right 3kms past Stonehenge.

## INSPECTION:

The bulls will be available for inspection at any time by appointment. Please contact Andrew (0438912884) or David (0427 175 037) to arrange a suitable time. Alternatively, all bulls will be yarded 90 minutes prior to the sale commencement.

## ANIMAL HEALTH:

All sale bulls have been vaccinated for:

- Vibrio
- 7 in 1
- Pestigard
- Rhinogard

Both herds have also tested free for pestivirus.

## DELIVERY:

Bannitup & Naranda will deliver for free within the Esperance Shire or contribute 50% of the transport costs for bulls sold further afield.

## SALE CATALOGUE DISCLAIMER:

All reasonable care has been taken by the vendor to ensure that the information provided in this catalogue is correct at the time of publication. However, neither the vendor nor the selling agents make any other representations about the accuracy, reliability or completeness of any information provided in this catalogue and do not assume any responsibility for the use or interpretation of the information included in this catalogue. You are encouraged to seek independent verification of any information contained in this catalogue before relying on such information.

# **BULL SALE**

**Thursday 14th March, 2024**

Naranda Springs, Esperance WA

Commencing at 10:30am

## **52 ANGUS BULLS**

Bulls are available for inspection on sale day from 9:00am

Or anytime by contacting Andrew or David

**David Johnson**

# WELCOME TO THE JOHNSON FAMILY'S SIXTH COMBINED ANGUS SALE

---

It is a pleasure to present to you our 2024 on-farm sale catalogue. This year we are offering 52 rising two-year-old bulls by both international and home bred bloodlines. We believe this years line-up is the best we have offered. We have had a laser focus on balancing the growth traits with the carcass traits, without blowing out birth weight or mature weight, and the rewards are starting to show. The bulls this year are beautifully muscled and deep bodied while still possessing high IMF rankings.

The bulls catalogued this year rank even higher than previous sales with over half in the top 25% and all but 5 ranked in the top 50% for the Angus Breeding Index. All the bulls have had carcass scanning, genomics and weight data completed and submitted to ensure the TACE figures are of the highest accuracy possible. Ben Glatz from South Australia examined the bulls' structure, and his findings are included with each lot in the catalogue. Ben has many years' experience structure scoring for top studs in the Eastern States and we believe his knowledgeable and independent opinion will benefit both our clients and our breeding decisions in the future. All bulls in the sale have also passed a BULLCHECK Veterinary bull breeding soundness examination. Several new sires will be represented this year, along with some old favourites.

Sons of **Baldrige Compass** will again be offered. His first daughters calved last season, and they produced big sappy calves while maintaining good body condition themselves - a trait I rate very highly. His sons also continue to be at the top of the weight rankings

We are really excited to be offering sons of **Baldrige Goalkeeper**. He is currently in high demand and his first son sold for \$110,000 as a yearling. He is a moderate birthweight, high growth bull with good carcass and exceptional structure. We've used him in subsequent matings and are excited to see how his first daughters will perform at this year's calving.

**SC Abundance** is another first-time sire. He is by G A R Ashland, out of a daughter of the great G A R Prophet. As you would expect from this combination, he offers a big birth to 600 day spread and exceptional carcass. Abundance has the greatest representation in the sale with 22 sons offered.

**Bannitup Recherche** is a bull we used to back-up the heifers AI program. He is a larger framed son of Rennyalea N184, with a striking B muscle score. It was a successful AI program so we only got a few sons from him and he subsequently hurt his shoulder fighting so unfortunately these will be the only sons offered.

**Naranda R6** was one of the top bulls at the 2022 sale. He was used over heifers because of his low birthweight, explosive early growth and moderate mature weight. He has top 25% carcass and top 1% structure.

We have done everything possible to ensure the bulls perform to their description and are fit to achieve great results in your herd. We hope you can all find a bull which serves your purpose. If you wish to view the bulls and discuss your requirements, please contact David or Andrew to organise a time.

Thank you for your continued support,

**David, Dale, Andrew and Khumo**

David, Dale, Andrew, and Khumo have asked us to conduct both a physical and reproductive examination of their entire sale team with the goal of being as comprehensive as possible. We share their objective of ensuring that your future bull is both well prepared to work within your production system and to deliver you the kind of calves you can happily retain for breeding or sell for a premium. We have thoroughly examined their reproductive organs, ensured they are capable of producing viable semen, inspected them visually, tested them to ensure that none of them are persistently Infected with BVD, and have set them up on a vaccination program designed to provide protection against reproductive diseases.

## **BULLCHECK Veterinary Bull Breeding Soundness Examination**

- Conducted to the standards of the Australian Cattle Vets.
- Testicular tone – 1 to 5. 1 is soft. 5 is hard. Score 4 is ideal.
- Scrotal circumference. Big is best. All need to be over 34cm
- Semen Motility – 30 to 60% is a qualified pass. Over 60% is ideal.
- Morphology – 50 to 70% is a qualified pass. Over 70% is ideal.

## **Pre-Sale Vaccination Protocol**

- 2 Doses of Vibrovax – For protection from *Campylobacter foetus* a sexually transmitted disease spread by bulls and causing spontaneous abortion in early pregnancy.
- 2 Doses of Ultravac 7 in 1 – To provide immunity to Leptospirosis, capable of causing abortion at any stage of pregnancy and capable of infecting human beings.
- Rhinogard – To provide protection from Bovine Herpesvirus, capable of causing penile and preputial breakdown, especially within the first couple of weeks of the joining season.
- Pestigard – To provide the bulls immunity to BVD which is capable of suppressing the immune system of the bull and if transmitted to cows of causing early embryonic death, abortion, or the production of Persistently Infected (PI) calves.

## **Pestivirus (BVD) Testing**

- Blood testing proved that none of the bulls within the sale team are PI or have ever been exposed to BVD which can lead to shedding of the virus from semen.

# BEEF CLASS STRUCTURAL ASSESSMENT

This year we engaged Ben Glatz from Lucindale in South Australia to carry out the structural assessment of the sale bulls. Ben has many years of experience in structure scoring and currently carries out assessments for many of the leading studs in the eastern states.

Structural soundness scores for TACE are collected using the Beef Class Structural Assessment System.

Scores are collected using a 1 – 9 scoring system, where;

- A score of 5 is considered ideal
- Scores of 4 and 6 show slight variation from ideal, but this includes most animals. Any animal scoring 4 and 6 would be acceptable in any breeding program
- Scores of 3 and 7 show greater variation, but would be acceptable in most commercial breeding programs, however seedstock producers should be wary
- Scores of 2 and 8 are low scoring animals and should be looked at carefully before purchasing

Scores of 1 and 9 should be considered culls

## MAXIMISING THE WORKING LIFE OF YOUR BULLS

---

Congratulations, you have chosen to purchase a bull destined to improve your herd's genetic profile and positively influence your profitability! What can you expect from your new bull and what are your obligations to keep him performing optimally?

Your bull has been vaccinated against exposure to BVD, Lepto, Vibrio, and Bovine Herpesvirus. Vaccinations are designed to limit the incidence and severity of infection should your bull come in contact with any of these diseases. We encourage you to continue to provide annual boosters by administering Pestigard, Ultravac 7 in 1, and Vibrovax to your bulls approximately a month prior to mating each year. We don't believe that in most cases annual boosters with either Bovilis MH + IBR or Rhinogard for Bovine Herpesvirus are necessary, though providing boosters to younger bulls would not have a negative impact. In our experience, most virgin bulls are exposed to Bovine Herpesvirus before or during their first mating season, sometimes resulting in infection and eventual breakdown of the bull's prepuce and penis. If you have suffered significant problems and wished to reduce the likelihood of preputial breakdown due even further to Bovine Herpesvirus in your bull's first season, a third dose of Bovilis MH + IBR or a dose of Rhinogard could be organized through your veterinarian for administration one week prior to mating.

Bulls are susceptible to parasitism. Counterintuitively, mating is stressful! Ensure that you have also wormed your bulls properly prior to mating. A modern molecule such as Dectomax or Cydectin delivered by injection will provide the best results. Some of the new combo drenches have also shown remarkable efficacy, such as Dectomax V. Individual doses can be organized through your veterinarian if necessary. The Esperance sand plain is renowned for mineral deficiencies, addressing multimineral concerns is similarly wise.

Your bull should be able to easily handle a booking of 2.5-3% or 30 to 40 cows. Peak activity should occur in the first three weeks of the mating season, in which over half of the breeders joined may fall pregnant depending upon their condition, plane of nutrition, and how recently they have calved. In essence, 60% of cycling cows can be expected to fall pregnant per cycle (21 days). If all of the cows are cycling, a fertile bull should achieve 85% over a six-week joining or over 90% in a nine-week joining, comprised of 60% in the first three weeks, 24% in the second three weeks (60% of the remaining 40%), and the remainder in the last three weeks.

Most bull breakdowns occur in the first three weeks of mating due to the bull's busy initial caseload as well as the potential for exposure to novel diseases. Please ensure that each of your bulls is visualized at least 2-3 times per week for the first three weeks of the mating season and at least weekly thereafter. Optimally bulls should be observed serving, best viewed from the right-hand side, and monitored for lameness or lethargy. Should a bull become injured, immediate sexual rest and/or veterinary intervention may salvage a bull otherwise destined for the abattoir.

Bulls with penises which prematurely corkscrew can develop, likely as a result of prior injury, over time, often progressively worsening as the bulls age. It is exceedingly rare for virgin bulls to corkscrew in their first season. Corkscrewing bulls ALWAYS corkscrew to the right-hand side. Bulls that consistently corkscrew are likely to produce few calves, and some are completely incapable of serving. Some producers ask us to "jump" or serviceability test their bull battery annually, some of which also choose to ask us to semen test their bulls at the same time. Regardless, keep an eye on your bulls during the mating season.

## MAXIMISING THE WORKING LIFE OF YOUR BULLS

---

Bulls can work well together in large groups, however, as the mating season progresses, the number of cycling females will decline, and bored bulls can start fighting. Restricting your mating to nine weeks can reduce bull aggression and ensures that a high proportion of cows are actually cycling when the bulls go in next season.

Even when bulls have been optimally prepared, single sire mating may still remain a risky proposition. If single sire mating, a good insurance policy would be to switch appropriate bulls halfway through the joining period.

Early pregnancy testing pays dividends. Identifying empty females as early as possible to salvage precious feed has obvious advantages. In addition, pregnancy testing early improves the probability of diagnosing the root cause of poor reproductive outcomes. If the bulls play a role, knowing which bulls were used in each mob can help immensely.

Good luck with your new bull from all of us at Naranda, Bannitup, and Swans Veterinary Services!

If you have any veterinary questions or concerns feel free to ring the clinic at 08 9071 5777, Enoch at 0427 716 907 or David at 0427 715 787.

**Enoch Bergman DVM**

**Swans Veterinary Service**

### **NARANDA AND BANNITUP ANGUS BULL GUARANTEE**

All bulls are guaranteed to be sound and healthy breeders for the first breeding season.

If for any reason a Bannitup or Naranda bull is unable to sire calves as a result of a failure his own fertility or structure we will either:

- Refund the purchase price less salvage value
- Give a credit towards future purchases

The purchaser will decide which of these options suit their needs.

All injured bulls must be diagnosed by a veterinarian and the results forwarded to us as soon as possible.

# UNDERSTANDING ESTIMATED BREEDING VALUES AND \$ INDEX VALUES

## Estimated Breeding Values (EBVs)

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These are called Estimated Breeding Values (EBVs). The EBV is therefore the best estimate of an animal's genetic merit for that trait. EBVs are expressed as the difference between an individual animal's genetics and the genetic base to which the animal is compared.

## Accuracy

An accuracy value is presented with every EBV and gives an indication of the amount of information that has been used in the calculation of that EBV. The higher the accuracy, the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives. The following guide is given for interpreting accuracy:

Accuracy Range	Interpretation
Less than 50%	Low accuracy and should be considered a preliminary estimate. The EBV could change substantially as more performance information becomes available.
50 – 74%	Medium accuracy, usually based on the animal's own records and pedigree.
75 – 90%	Medium-high accuracy and usually includes some progeny information becoming a more reliable indicator of the animal's value as a parent.
90% and above	High accuracy. It is unlikely that the EBV will change much with the addition of more progeny data.

As a rule, animals should be compared on EBVs regardless of accuracy.

However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

## Traits

### 1. Calving Ease

EBVs are based on calving ease (CE) scores, birth weights and gestation length information.

More positive EBVs are favourable and indicate easier calving.

**DIR:** Direct calving ease indicates how this animal influences the birth of its progeny.

**DTRS:** Daughter's calving ease indicates how well the animal produces daughters that have easier calving.

### 2. Birth

**Gestation Length** EBV (days) is based on AI records. Lower (negative) EBVs indicate easier calving and increased growth after birth.

**Birth Weight** EBV (kg) is based on the measured birth weight of animals, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

### 3. Growth

**200-Day Milk** EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV is indicative of their daughter's milking ability as it affects the 200-day weights of their calves.

**200-Day Growth** EBV (kg) is calculated from the weight of animals taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

**400-Day Weight** EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

**600-Day Weight** EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

**Mature Cow Weight** EBV (kg) is an estimate of the genetic difference in cow weight at 5 years of age. Moderate EBVs are generally more favourable.

### 4. Fertility

**Scrotal Size** EBV (cm) is an indicator of male fertility in regard to semen quality and quantity. Higher (positive) EBVs indicate higher fertility. Scrotal size is also positively associated with female fertility.

**Days to Calving** EBV (days) is an indicator of genetic differences in female fertility, expressed as the number of days from the start of the joining period until subsequent calving. Lower (negative) EBVs indicate more favourable female fertility.

**Carcase Weight** EBV (kg) estimates the genetic difference in carcass weight at a standard age of 750 days.

# UNDERSTANDING ESTIMATED BREEDING VALUES AND \$ INDEX VALUES

**Eye Muscle Area** EBV (cm<sup>2</sup>) estimates genetic differences in eye muscle area at the 12/13th rib site of a 400kg dressed carcass. More positive EBVs indicate larger eye muscle area and therefore, higher retail beef yields.

## 5. Carcass

**Rib Fat EBV** (mm) estimates the genetic differences in fat depth at the 12/13th rib in a 400kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

**Rump Fat EBV** (mm) estimates the genetic differences in fat depth at the P8 site of a 400kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

**Retail Beef Yield Percent** EBV (%) represents total (boned out) meat yield as a percentage of a 400kg dressed carcass. A more positive EBV indicates higher percentage yield for the 400kg carcass weight.

**Intra-Muscular Fat Percent** EBV (%) is an estimate of the genetic difference in the percentage of intra-muscular fat at the 12/13th rib site in a 400kg carcass. Depending on market targets, larger more positive values are generally more favourable.

## 6. Net Feed Intake

**Net Feed Intake (feedlot finishing)** EBV (kg per day) is an estimate of genetic differences between animals in feed intake at a standard weight and rate of weight gain when animals are in a feedlot finishing phase. NFI-F EBVs are expressed as kilograms (kg) of feed intake per day.

## 7. Docility

**Docility** EBV (%) is an estimate of genetic differences between animals in temperament. Docility EBVs are expressed as differences in the percentage of progeny that will be scored with acceptable temperament (i.e. either “docile” or “restless”).

## 8. Selection Index

New selection indexes were introduced for Angus seedstock cattle in the December 2021 TransTasman Angus Cattle Evaluation (TACE).

The new selection indexes replace the previous Angus Breeding, Domestic, Heavy Grain and Heavy Grass selection indexes, which have been published since 2014. Ten selection indexes are now published for animals within the TransTasman Angus Cattle Evaluation.

Index Name	Abbreviation
Angus Breeding Index	\$A
Domestic Index	\$D
Heavy Grain Index	\$GN
Heavy Grass Index	\$GS
Angus Breeding Low Feed Cost Index	\$A-L
Domestic Low Feed Cost Index	\$D-L
Heavy Grain Low Feed Cost Index	\$GN-L
Heavy Grass Low Feed Cost Index	\$GS-L
AngusPRO Index	\$PRO
Angus Terminal Sire Index	\$T

Low feed cost versions of each selection index have been introduced to cater for Angus breeders who are running a production system where pasture is not fully utilised for the majority of the year, or where the cost of supplying additional feed, via either supplementary feeding and/or increased pasture production, is low.

In these production systems, if there is an increase in the maintenance requirements of the breeding herd due to an increase in mature weight, minimal additional costs are incurred.

The low feed cost selection indexes do not consequently aim to limit an increase in mature cow weight, while improvement in other production traits is achieved, which is an objective in the other versions of these selection indexes.

The new selection indexes also see the introduction of an Angus Terminal Sire selection index for use in situations where Angus bulls are being used as a terminal sire over mature breeding females.

Because of the increased number of indexes we have decided to publish only the \$A and \$A-L indexes in this catalogue. The full array of indexes are available by logging onto the Bannitup and Naranda sale listing on the Angus Australia web site.

The Angus TACE Estimated Breeding Values contained in this Sale Catalogue were compiled by the Agricultural Business Research Institute (ABRI) from data supplied by the breeders. Neither Angus Australia, the New Zealand Angus Association nor the ABRI oversee or audit the collection of this data.

### Notes

Goalkeeper has been a high demand sire over the last few years. He currently has 750 progeny analysed and would expect this number to keep growing. We have continued to use him and are retaining a son who we plan to use heavily. Goalkeeper progeny are peas in a pod and are exactly as his EBV's suggest. Thick, deep bulls with impeccable structure and big scrotal circumference. Best of all they are puppy dog quiet.

### Notes

Compass was the pick bull of the "great eight" flush brothers who dominated the 2016 Baldrige sale. The flush was out of the breeds iconic dam, Isabel Y69 and included Bronc and 38 Special. Other maternal brothers include beast mode and Colonel. Compass first daughters calved last season and their calves weaned big and sappy while they maintained their body condition. Compass will leave a large, positive imprint on our herd.

### Notes

Abundance combines two of the breed's great sires in Ashland and Prophet who between them have 6,500 progeny registered in Australia. The Abundance sons are smooth shouldered and offer a little more frame than the other American bulls. Abundance was largely used on heifers and many of his sons would be suitable for this purpose.

**Notes**

Recherche damaged his shoulder as a yearling so he wasn't used as a 2 year old. We subsequently used him to mate some commercials as a 3 year old but replaced him after 2 cycles in case his shoulder was an issue. We shouldn't have worried, he had all but 2 pregnant. Recherche is a lager framed bull who was used over heifers. He is a good carcase bull with great muscle expression. He also had impeccable structure which he has passed on to his progeny.

BALDRIDGE ISABEL Y69

NARANDA F5

**Notes**

P1 has been used over heifers at both Bannitup and Naranda because of his amazing birth to 400 day growth spread. His daughters are in production and have performed well. A son, S14 was retained and used within the Naranda herd with good results.

**Notes**

R6 is another retained son of N184, this time out of a very good Bronc daughter. Like P1 he also has a very desirable birth to 400 day growth spread. R6 has good carcase and breed leading structure EBV's.

**Notes**

R68 is a high growth Beast Mode son. I mentioned earlier how good the K1111 daughters are and R68's dam is a classic example. The R68 sons have consistently been amongst the heaviest since weaning and also have good carcase and excellent structure.
